### All-In-One eDiscovery and Document Review

By Taeho Lim

Wouldn't it be nice to tap into every type of document analysis or search tool available today? If you want to do that with your eDiscovery cases, you have two choices — use multiple single-function programs and hope you can get them to integrate with one another, or use a single multiple-function program that does everything. If the latter approach sounds better to you, check out Discovery360 from InterLegis.

Discovery360 aims to streamline the eDiscovery process by providing the functionality of multiple eDiscovery applications in one convenient package. Its functionality includes: eDiscovery culling and processing, document attribute and conceptual clustering, natural language search, Boolean search, similarity matching, metadata filtering, email threading, proactive relevancy alerts, native or TIFF review, real-time reviewer reporting, on-the-fly productions, bulk issue coding, and more.

With all these tools in one application, Discovery360 simplifies each of the steps in the eDiscovery process, enabling you to cull and process documents, store, manage, analyze, review, and produce them as needed.

For example, the new "DataMapper" module enables case administrators to cull relevant documents using a wide range of criteria — keywords, custodian, date ranges, concepts, relevant metadata, or just about anything else

you specify. Culling can eliminate 20-80% of irrelevant files depending on the situation. DataMapper can find and eliminate duplicates, and can also run "What If" scenarios so that you can get a sense of how many documents a certain decision would remove before actually doing so. DataMapper provides real-time reports throughout the process, all the while giving you control of your data and saving money too.

Once you have your data set in place, Discovery360 makes all document attributes searchable, including keywords, concepts, all metadata, timelines, and document relationships. During this process, Discovery360 also places documents into concept folders, identifies and groups email threads and similar documents (near duplicates), etc. — all aimed at reducing your workload. You can also add relevant paper documents to the mix to maintain a single, normalized database. Learn more about Discovery360:
